R1 · RESEARCHER GUIDE

Researcher onboarding

Cross-teacher observation and the rubric experimentation workspace.

> **For researchers**
>
> A researcher account layers **cross-teacher** views, the ability to **edit on a teacher's behalf**, and a **rubric experimentation** workspace on top of the normal teacher surfaces. Researcher access is a role an administrator grants to your account (see *Getting access* below).

What a researcher can do

Four capabilities beyond a normal teacher account:

1. **Observe across the whole cohort** — every teacher's classes, activities, engagement and cost.
2. **Help a teacher directly** — open any teacher's class or activity and change it: rename the class, add or create an activity in it, mint a join code, share or unshare an activity. An activity you create inside a teacher's class belongs to *them* — it appears in their own library and they can edit it without you. You cannot delete a teacher's class.
3. **Maintain the teaching approaches** — edit the seven published approaches that tutors teach with, and see which tutor teaches with what.
4. **Experiment with rubrics** — author and version the judge prompts (lenses) used to score student sessions, and run a judge over a captured session.

When you edit something you do not own, the page tells you whose it is, and the teacher's page afterwards says **who last edited it** and when. Every such edit is also

recorded for audit.

Getting access

The researcher role is a claim an administrator sets on your account (via `aiplatform users grant-researcher <uid>`). Once granted, sign out and back in so your session picks up the new role. You will then see the extra controls described below — scope toggles on **Classes** and **Activities**, extra tabs under **Insights**, extra tabs under **Approaches** (account menu), and a **Programme** item in the sidebar. Without the role, these surfaces show a "Researcher access required" message.

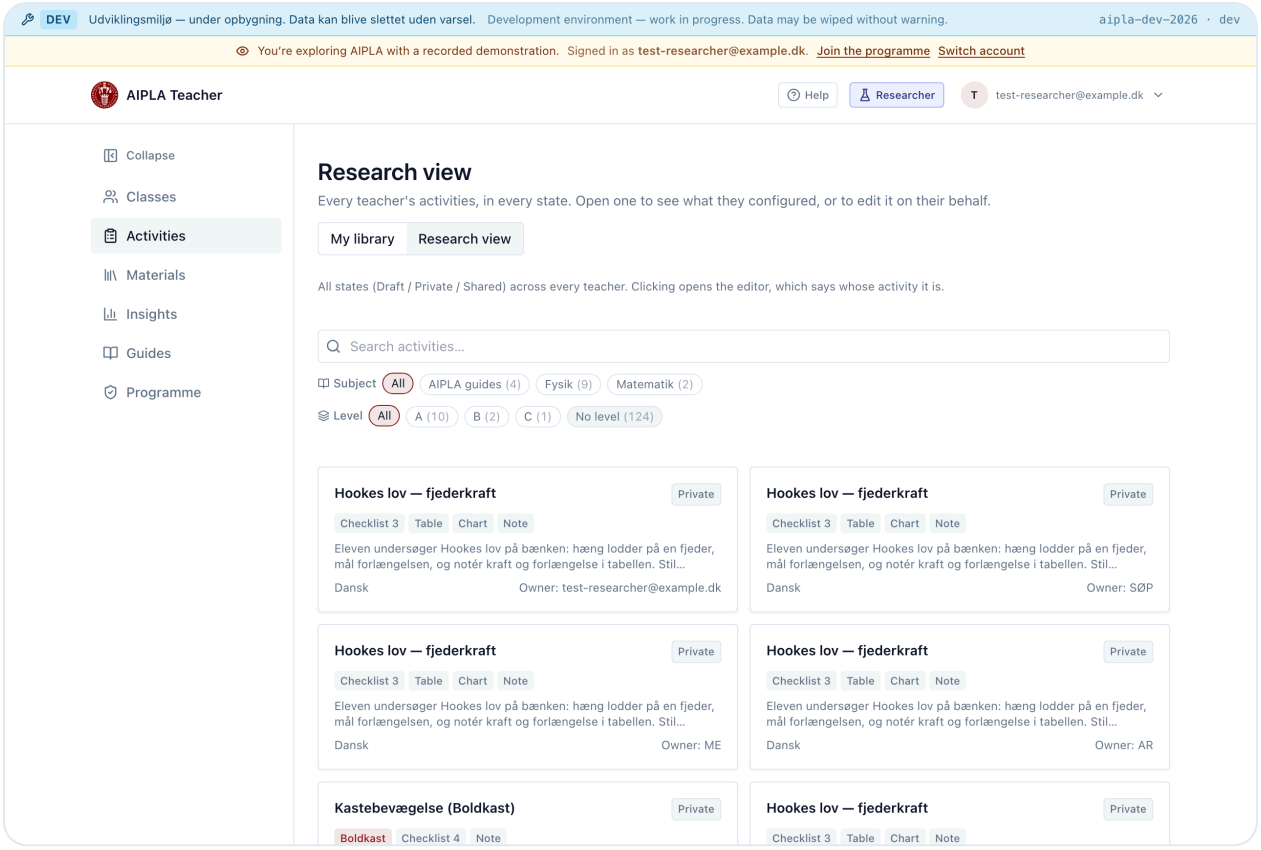

With the role, the screens default to **English**. To read them in Danish, use the **DA | EN** switch in the account menu (top right); your choice is remembered in this browser.

Cross-teacher observation

- **Research view (activities)** — on **Activities**, a **My library / Research view** toggle opens a scan of *every* teacher's activities, in every state (Draft / Private / Shared), with the owner shown. Use it to see what is being built across the cohort. Open one to see exactly what the teacher configured and, if needed, change it on their behalf — the editor says whose it is.
- **Research view (classes)** — on **Classes**, a **My classes / Research view** toggle switches the list to every teacher's classes; **Manage** opens any of them with the same controls the teacher has.
- **Insights across all teachers** — on **Insights**, a **My classes / All teachers** scope toggle widens the engagement comparison to the whole cohort.
- **Conversations** — a researcher-only tab under **Insights**: every student conversation, grouped by the teaching approach that produced it, with the transcript one click away (**Read**). The transcript shows the group's workspace work — table entries, writing, checklist ticks, simulation events — between the turns where it happened, and **What they ended with** beside it shows the group's

final saved work on that activity. **Export CSV** and **Export JSONL** download the turns under the selected approach.

- **Cost** — a researcher-only **Cost** tab under Insights breaks cross-class spend down by cohort, model, voice (speech-to-text / text-to-speech) and class, over a period you choose.

The cross-teacher research surfaces — every teacher and class, with the owner shown.

Teaching approaches and tutors

Open **Approaches** from the account menu (top right). As a researcher you get:

- **Approaches** — the seven published approaches. **Edit teaching approach** changes an approach's constructs; the tutor's prompt is rebuilt from them, so it stays traceable to the source paper. Below them are the custom approaches teachers and researchers have written.
- **Who teaches with what** — change which approach a tutor teaches with, in every class that uses it.

- **Try them** — ask two tutors the same question side by side, and see what each was told.
- **Tutors** and **Faces and voices** — build tutors, the same panels teachers have.
- **Usage** — every approach, who wrote it, how many tutors use it and how many turns it has taught.

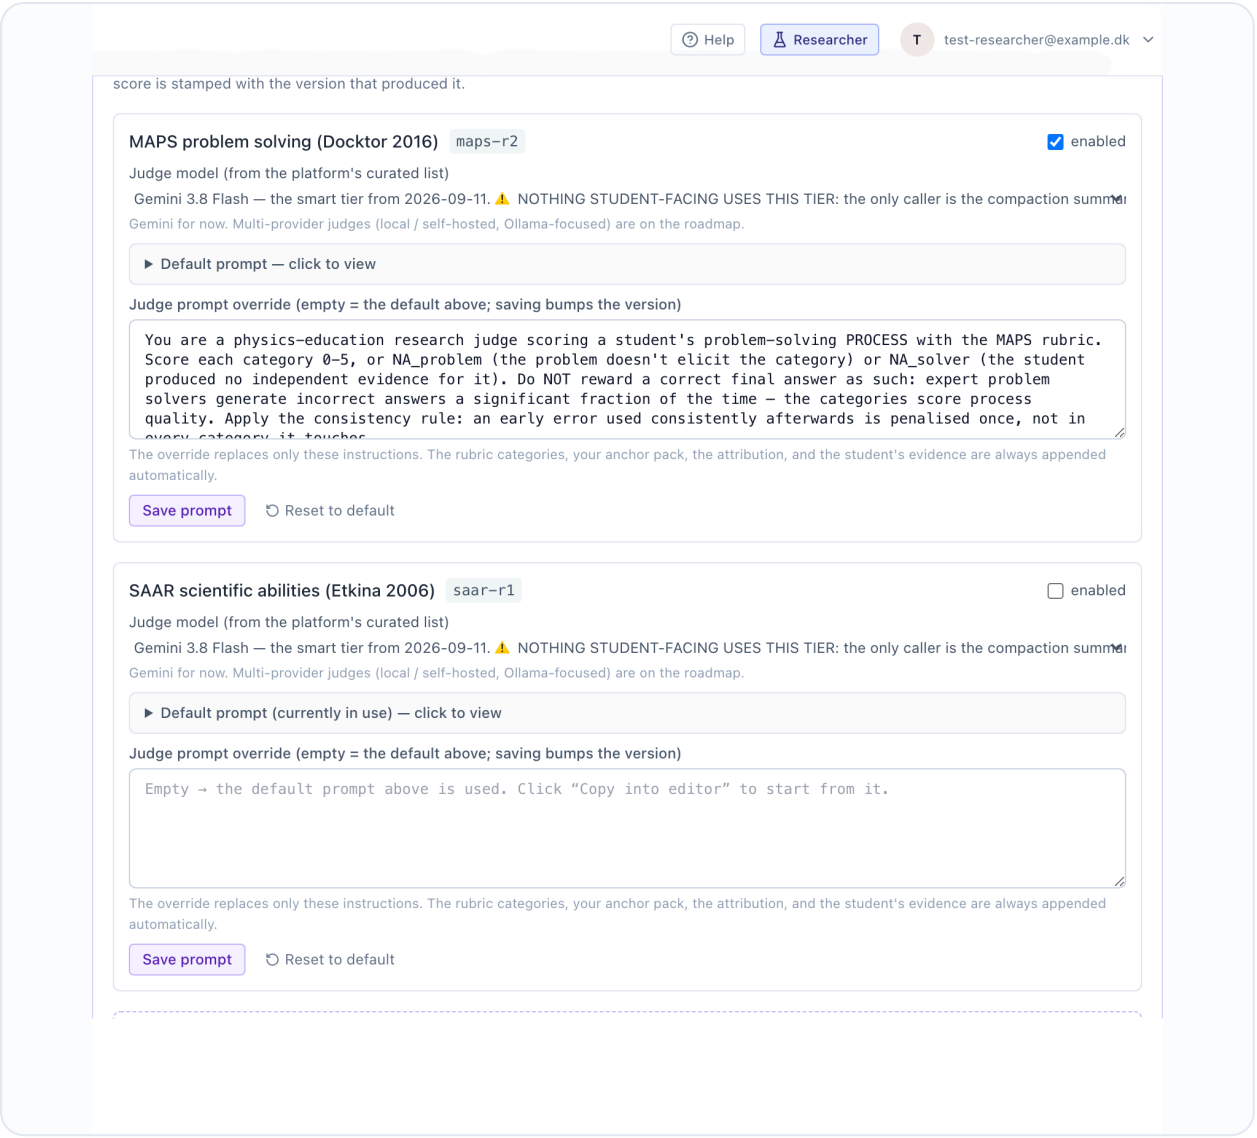

The **Tutor co-pilot** on this page proposes constructs for an approach and can search the papers held in the private literature corpus; citations stay yours to vouch for.

Writing a custom approach and building a tutor on it does **not** need the researcher role — any teacher can, on **Your approaches** and **Tutors** (guide *T1*, *Make your own tutor*). Only editing the seven published approaches is researcher-only.

Rubric experimentation

Under **Settings**, the **Research · judge lenses** panel is where you shape and test how student sessions are scored:

- **Judge lenses** — for each lens you can enable/disable it, choose the **judge model**, inspect the **default prompt**, and write a **judge prompt override**. Saving an override **bumps its version**, so you can iterate on the wording and keep the history. **Reset to default** reverts it.
- **Experiment — score a captured session** — paste a session id, pick a lens, and **Run judge** to see the score profile that lens produces on real data (or an "Abstained" result when the lens declines to score).

The rubric experimentation panel: versioned judge prompts and a judge you can run on a captured session.

This is the workflow for developing the capability-floor rubrics: change a lens prompt, run it against known sessions, compare the profiles, and promote a version when it behaves.

Next steps

- The teacher-facing surfaces work as documented in *T1–T4*; the researcher views sit alongside them.
