T2 · TEACHER GUIDE

Create your first activity

Build a guided activity: teaching goal, workspace, and live preview.

Before you start

An activity always belongs to a **class**. If you have not created a class yet, follow guide *T1 — Set up a class and share it* first, then come back here. This guide takes about five minutes.

Short on time? The **Getting started** card on *Classes* offers **Adopt from the library** — a colleague's shared activity copied into your class in one click, no builder needed. Come back here when you want to make your own.

What an activity is

An **activity** is a single guided task your students open in the tutor. You set the teaching goal and, optionally, a workspace — a simulation, a table, a chart, a calculator, or guiding notes. Students join with the class group code and work through the activity in conversation with the AI physics tutor, which follows the goal you set.

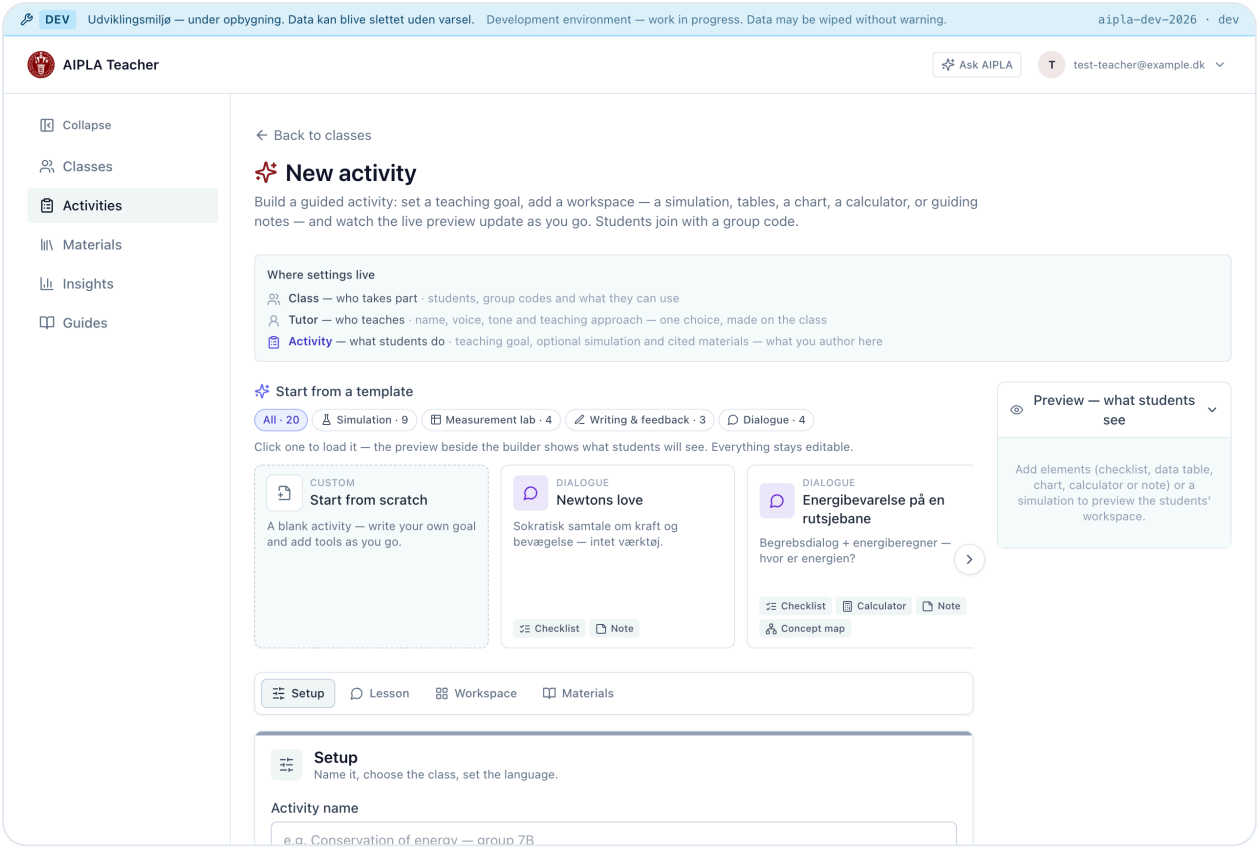

You do not need to write any code, and you do not need a developer. Everything on this page is done in your browser.

Prefer to describe it in words?

The builder has an AI **co-pilot** (**Ask AIPLA** → *Medbygger*). Tell it what you want to teach and it drafts a teaching goal and workspace elements you can edit and apply — see *T4 — Author with the AI co-pilot*. Every step below can also be done by the co-pilot, not only by hand.

Step 1 — Open the activity builder

From your teacher area, open **Classes**, choose the class this activity is for, and select **New activity**. (You can also reach the builder from the class page's **New activity** button, which pre-selects that class for you.)

The activity builder opens with a template picker at the top and a live preview on the right.

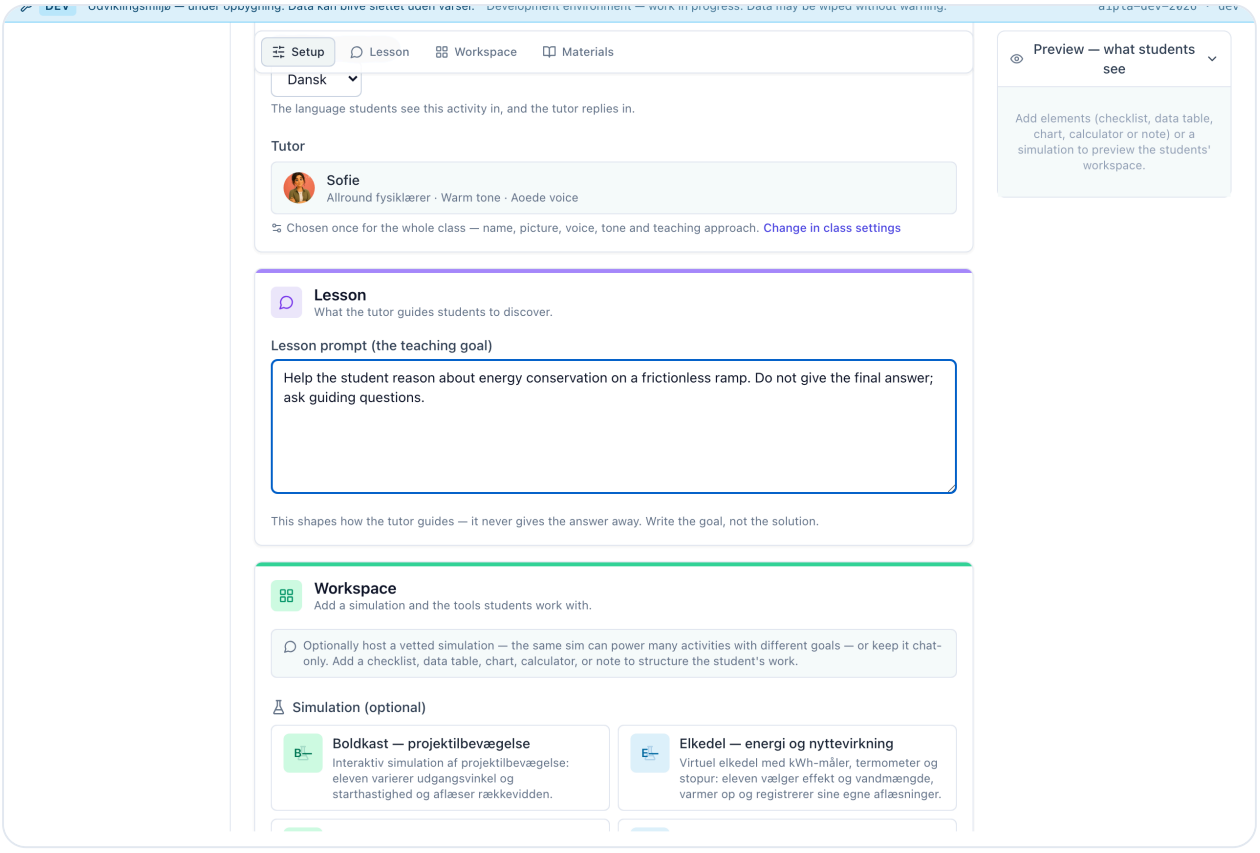

Step 2 — Choose a starting point

At the top of the builder is **Start from a template**. Click a template close to what you want — it fills in a sensible starting configuration, and the preview beside the builder shows what students will see — or choose **Start from scratch**. You can change everything afterwards, so the choice is not binding.

Step 3 — Set the teaching goal

The builder has four sections: **Setup**, **Lesson**, **Workspace** and **Materials**. Under **Setup**, give the activity an **Activity name**. Under **Lesson**, write the **Lesson prompt (the teaching goal)**. The goal is the most important field: it is the instruction the tutor follows when it talks to your students. Write it as you would brief a teaching assistant — for example, *"Help the student reason about energy conservation on a frictionless ramp; do not give the final answer, ask guiding questions."*

Under **Setup**, also set **Students' language** — the language students see the activity in and the tutor replies in. (A student can still switch DA | EN for themselves.) The tutor itself comes from the class (guide *T1*); the Setup section shows which one will teach.

The teaching goal is the instruction the tutor follows. Keep it specific.

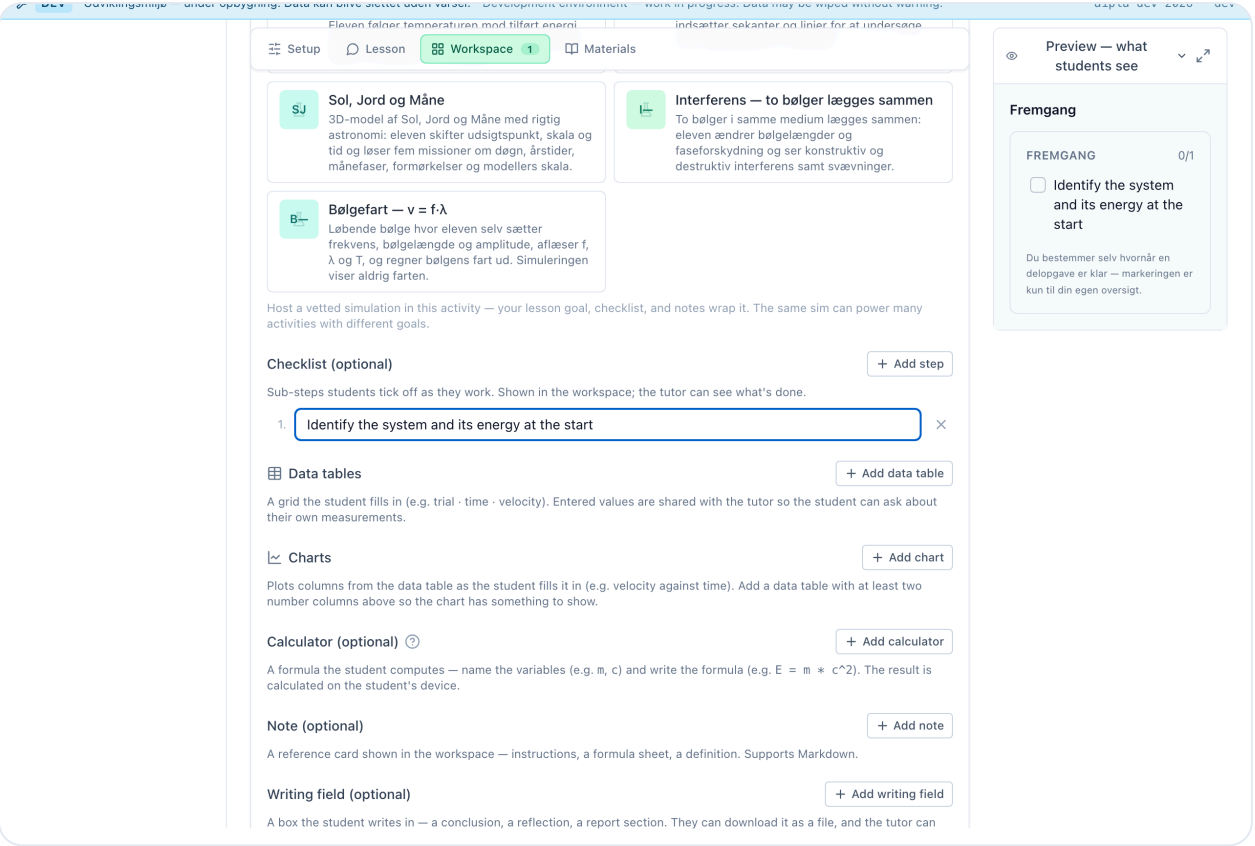

Step 4 — Add a workspace (optional)

In the **Workspace** section, add the elements your students will use — a simulation, a checklist, a table to fill in, a chart, a calculator, or notes — or leave it empty for a chat-only conceptual dialogue. The **live preview** on the right updates as you add each element, so you see exactly what the student will see.

> **Tip**
>
> Anything the student does in the workspace — values they enter, a simulation they run — is shared with the tutor, so it can respond to their actual work.

Building your own simulation?

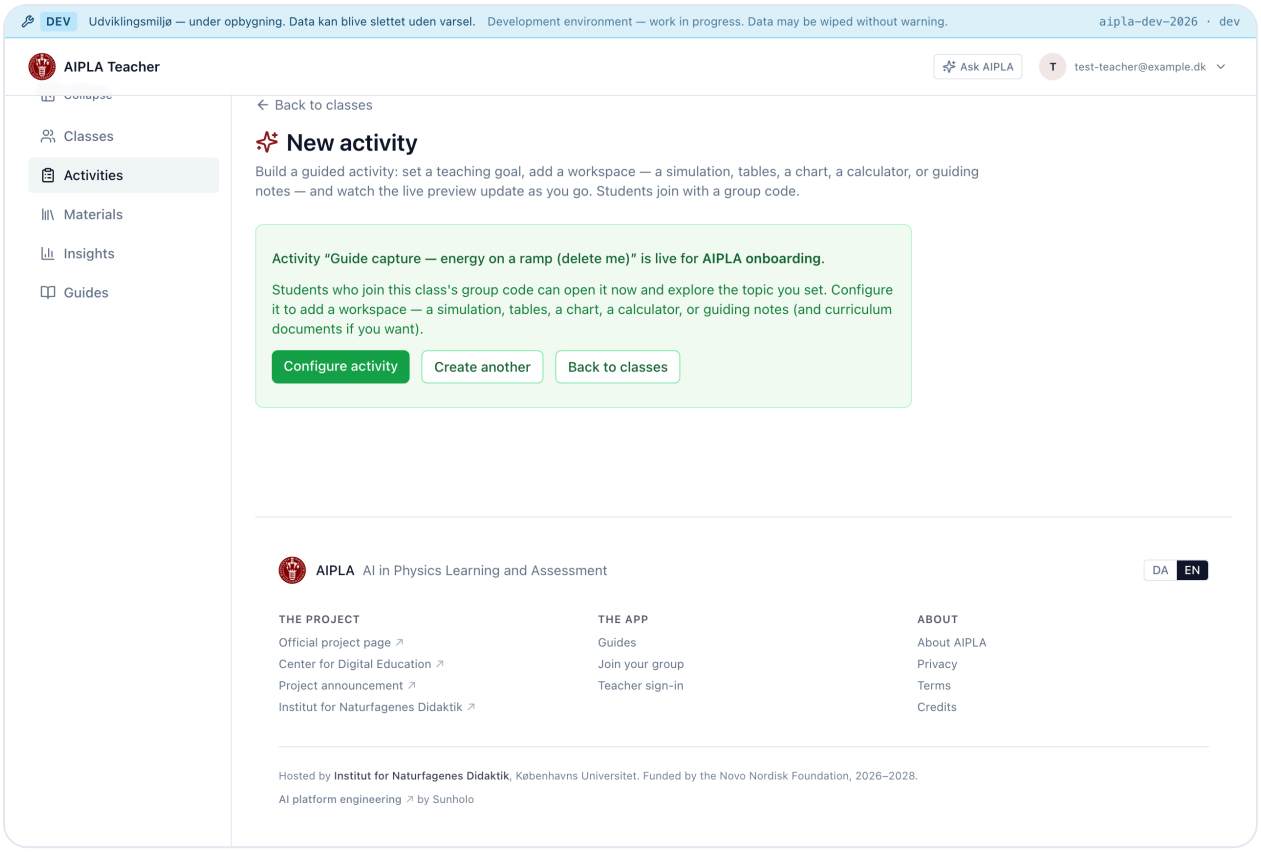

Start from the standard authoring prompt rather than a blank chat. Copy it from https://aipla.ku.dk/project/build-a-simulation (https://aipla.ku.dk/project/build-a-simulation), or give your AI chat the plain file https://aipla.ku.dk/sim-authoring-prompt.txt (https://aipla.ku.dk/sim-authoring-prompt.txt). A simulation built from it tells the tutor when a student takes a measurement or finishes a mission, so the tutor responds without you prompting it, and its control panels fold away so they do not cover the simulation on a laptop or phone. A simulation built without it can work well and still miss both.

The live preview shows the student's view as you build.

Step 5 — Create the activity

When you are happy with the preview, select **Create activity**. You will see a confirmation that the activity is live for your class.

The activity is now live; students who join the class group code can open it.

From the confirmation you can:

- **Configure activity** — reopen it to add curriculum documents or refine the goal (see *T3 — Add and organise curriculum materials*). Once it is saved, **Try as student** there opens the real student view in a new tab, tutor included, with no join code.
- **Create another** — start a fresh activity for the same class.
- **Back to classes** — return to your class list.

What students see

Students open the activity from the class group code (no login, no personal account — see *S1 — Join and use your tutor*). They get the tutor and, if you added one, the workspace. The tutor follows the goal you set and can see the work the student does in the workspace.

Next steps

- Add curriculum documents so the tutor can ground its answers in your materials — *T3*.
- Let the AI authoring co-pilot draft an activity from a plain-language description — *T4 — Author with the AI co-pilot*.
