T3 · TEACHER GUIDE

Add and organise curriculum materials

Attach documents the tutor can cite, and keep them organised.

Where this fits

Curriculum materials are cited **inside an activity** (guide *T2*). Open an activity, go to its **Materials** section, and attach the documents you want the tutor to draw on. To upload and file documents without opening an activity, use **Materials** in the teacher navigation — the same library, without the activity-specific controls.

The labels below are the English ones. The teacher screens follow the **DA | EN** switch; in Danish the section is called **Materialer**.

What materials do

When you attach a document to an activity, the tutor can **cite it** — ground its answers in your source rather than in general knowledge. You can attach:

- documents from the **shared corpus** — material already available to you, and
- your **own uploads** — a PDF, slides, a worksheet, notes, or an image.

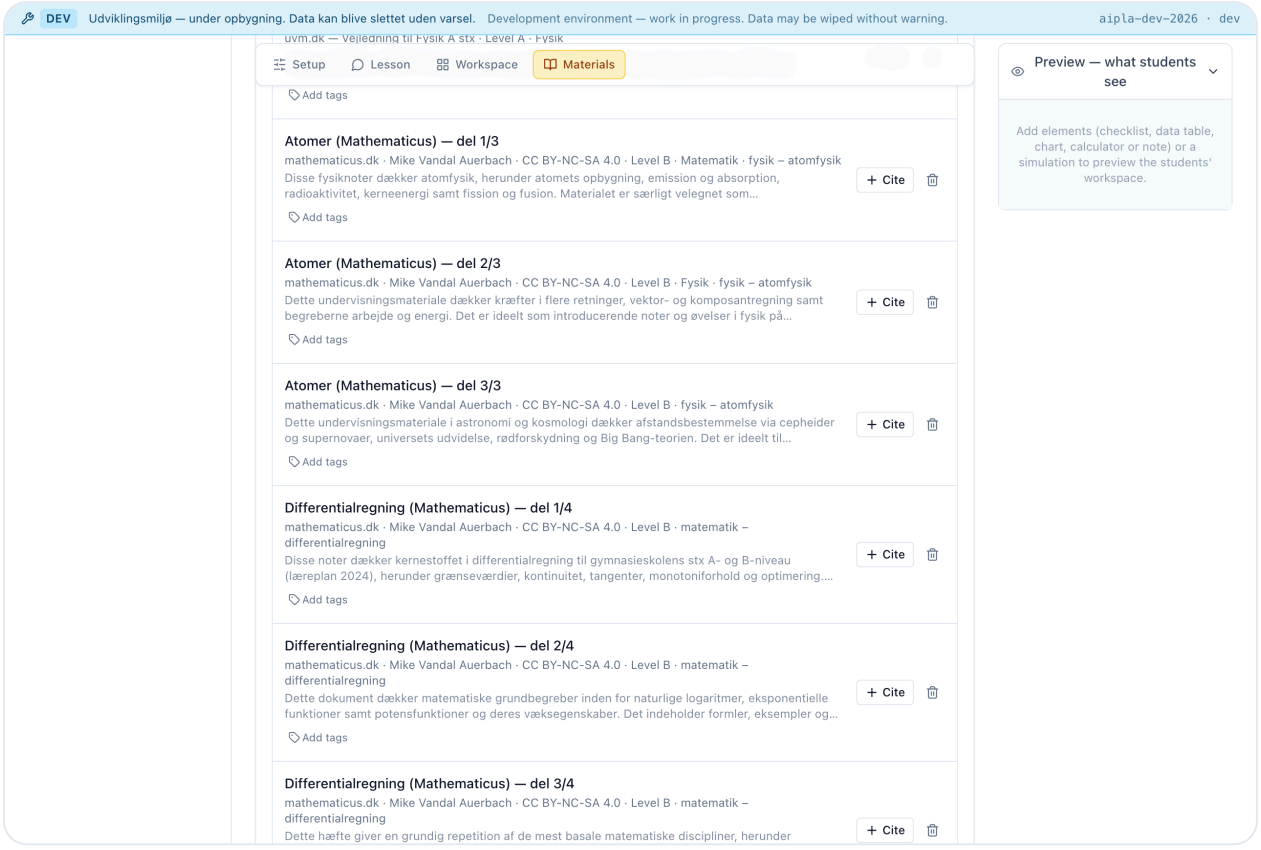

Each attached document is either **Students can open it** or **Tutor only** (used only to ground the tutor), and either **Reference** (the tutor looks it up when relevant) or **In context** (the tutor is given the full text on every turn). You choose per document.

The co-pilot can help here too

When it drafts an activity, the AI **co-pilot** can also suggest curriculum materials to attach — see *T4 — Author with the AI co-pilot*. You can always add and organise materials by hand as below.

Step 1 — Open the Materials section

Open an activity for editing (or create one — guide *T2*). In the builder's section navigation, select **Materials**. The section lists the shared corpus you can browse, with an **Upload** button and controls to filter and organise.

The Materials section: browse the shared corpus, upload your own, filter by subject, folder, level or tag.

Step 2 — Attach a document

You have two ways to attach material:

- **Cite an existing document.** Use the **Search materials** box or the **Subject**, **Folders**, **Level** and **Tags** filters to find what you want, then select **Cite** on its row. It moves into the activity's cited list.
- **Upload your own.** Select **Upload** and choose a file (PDF, Word, slides, spreadsheet, plain text, or an image). A document is cited straight away, and AIPLA shows you **what it extracted**, so you can confirm it was read correctly before relying on it. An image is not text-extracted — the tutor sees the picture itself; save the activity once before uploading one.

After an upload, AIPLA shows the extracted text so you can verify the parse.

Select a document's title at any time to see what was extracted from it again.

Step 3 — Organise: folders, tags and subject

Keep a growing corpus navigable:

- **Folders** — group related documents; create one with **New** in the **Folders** row. Deleting a folder unfiles its documents rather than deleting them.
- **Tags** and **Subject** — select **Add tags** (or **Edit**) on a document to set its subject, folder and tags, so the filters can find it later. On the **Materials** page the same button reads **Organise**.

An upload is filed into whatever subject and folder you are filtered to at the time. Organisation on the shared corpus is shared, so a document you tag well is easier for you and your colleagues to reuse across activities. Your own uploads stay in your own library; only researchers can add an upload to the shared library. The bin icon on a row deletes a document from the library.

Step 4 — Control what students see, and what the tutor always has

Each cited document has two toggles:

- **Students can open it / Tutor only** — a *Tutor only* document still grounds the tutor's answers; one students can open also appears in their workspace. Newly cited documents start as **Tutor only** — share one only when you want students to read the source directly. The first document students can open is marked **Opens first for students**: it is already open when they arrive, and tabs switch to the others. The order is the order you added them in. When the tutor names a shared document, the name is a link that opens it; it never links a *Tutor only* one. (Images still use **Visible / Hidden**.)
- **Reference / In context** — **Reference** (the default) lets the tutor look the document up when it is relevant, which suits a textbook. **In context** gives the tutor the full text on every turn: use it for the task your students are working on, so the tutor never has to search for it or ask them to paste it in.

> **Tip**
>
> Grounding works whether students can open a document or not. Use *Tutor only* for source material that should shape the tutor's answers without being handed to students verbatim.

Next steps

- Let the AI co-pilot assemble an activity — including suggested materials — from a description: *T4 — Author with the AI co-pilot*.
