

Create your first activity

Build a guided activity: teaching goal, workspace, and live preview.

Before you start

An activity always belongs to a **class**. If you have not created a class yet, follow guide *T1 — Set up a class and share it* first, then come back here. This guide takes about five minutes.

What an activity is

An **activity** is a single guided task your students open in the tutor. You set the teaching goal and, optionally, a workspace — a simulation, a table, a chart, a calculator, or guiding notes. Students join with the class group code and work through the activity in conversation with the AI physics tutor, which follows the goal you set.

You do not need to write any code, and you do not need a developer. Everything on this page is done in your browser.

Prefer to describe it in words?

The builder has an AI **co-pilot** (bottom-right). Tell it what you want to teach and it drafts a teaching goal and workspace elements you can edit and apply — see *T4 — Author with the AI co-pilot*. Every step below can also be done by the co-pilot, not only by hand.

Step 1 — Open the activity builder

From your teacher area, open **Classes**, choose the class this activity is for, and select **New activity**. (You can also reach the builder from the class page's **New activity** button, which pre-selects that class for you.)

The activity builder opens with a template picker at the top and a live preview on the right.

Step 2 — Choose a starting point

At the top of the builder is a **template picker**. Pick a template close to what you want — it fills in a sensible starting configuration — or start from blank. You can change everything afterwards, so the choice is not binding.

Step 3 — Set the teaching goal

Give the activity a **title** and a **teaching goal**. The goal is the most important field: it is the instruction the tutor follows when it talks to your students. Write it as you would

brief a teaching assistant — for example, *"Help the student reason about energy conservation on a frictionless ramp; do not give the final answer, ask guiding questions."*

Set the **language** the tutor should use with students, and pick a **workbench type** if this activity needs a workspace (or leave it as a chat-only conceptual dialogue).

The screenshot shows a configuration interface for a teaching activity. It is divided into three main sections: Setup, Lesson, and Workspace. The Setup section includes a Language dropdown set to 'Dansk', a Tutor persona selection for 'Sofie' (Allround fysiklærer - Warm style - Aoede voice), and a link to 'Change in class settings'. The Lesson section contains a 'Lesson prompt (Socratic teaching goal)' text box with the instruction: 'Help the student reason about energy conservation on a frictionless ramp. Do not give the final answer; ask guiding questions.' Below this is a note: 'This shapes how the tutor guides — it never gives the answer away. Write the goal, not the solution.' The Workspace section is titled 'Add a simulation and the tools students work with.' and includes an optional simulation choice. Two options are visible: 'Boldkast — projektilbevægelse' (Interactive simulation of projectile motion) and 'KineBot — kinematics & motion graphs' (Interactive kinematics: the student sets motion parameters and reads position/velocity/acceleration graphs). A 'Preview — what students see' panel on the right shows a preview of the workspace elements.

Setup Lesson Workspace Materials

Language
Dansk

Tutor persona
Sofie
Allround fysiklærer - Warm style - Aoede voice
Set for the whole class — avatar, voice & teaching style. [Change in class settings](#)

Lesson
What the tutor guides students to discover.
Lesson prompt (Socratic teaching goal)
Help the student reason about energy conservation on a frictionless ramp. Do not give the final answer; ask guiding questions.
This shapes how the tutor guides — it never gives the answer away. Write the goal, not the solution.

Workspace
Add a simulation and the tools students work with.
Optionally host a vetted simulation — the same sim can power many activities with different goals — or keep it chat-only. Add a checklist, data table, chart, calculator, or note to structure the student's work.

Simulation (optional)

B Boldkast — projektilbevægelse
Interaktiv simulation af projektilbevægelse: eleven varierer udgangsvinkel og starthastighed og aflæser rækkevidden.

K KineBot — kinematics & motion graphs
Interactive kinematics: the student sets motion parameters and reads position/velocity/acceleration graphs.

Preview — what students see
Tilføj elementer (tjekliste, datatabel, graf, beregner eller note) eller en simulation for at se en forhåndsvisning af elevernes arbejdsområde.

LED Planck — bestem Plancks konstant

The teaching goal is the instruction the tutor follows. Keep it specific.

Step 4 — Add a workspace (optional)

If you chose a workbench, add the elements your students will use — a simulation, a table to fill in, a chart, a calculator, or notes. The **live preview** on the right updates as you add each element, so you see exactly what the student will see.

Tip

Anything the student does in the workspace — values they enter, a simulation they run — is shared with the tutor, so it can respond to their actual work.

The screenshot displays the activity builder interface. The main workspace on the left contains several components: a 'Simulation (optional)' section with three options (Boldkast, KineBot, and LED Planck), a 'Checklist (optional)' section with one item 'Identify the system and its energy at the start', a 'Data table (optional)', a 'Chart (optional)', a 'Calculator (optional)', a 'Note (optional)', and a 'Solution editor (optional)'. Each component has a brief description and an 'Add' button. The right sidebar shows a 'Preview — what students see' view, which includes a 'Fremgang' (Progress) section with a checklist item 'Identify the system and its energy at the start' and a progress indicator '0/1'.

The live preview shows the student's view as you build.

Step 5 — Create the activity

When you are happy with the preview, select **Create activity**. You will see a confirmation that the activity is live for your class.

The activity is now live; students who join the class group code can open it.

From the confirmation you can:

- **Configure activity** — reopen it to add curriculum documents or refine the goal (see *T3 — Add and organise curriculum materials*).
- **Create another** — start a fresh activity for the same class.
- **Back to classes** — return to your class list.

What students see

Students open the activity from the class group code (no login, no personal account — see *S1 — Join and use your tutor*). They get the tutor and, if you added one, the workspace. The tutor follows the goal you set and can see the work the student does in the workspace.

Next steps

- Add curriculum documents so the tutor can ground its answers in your materials — *T3*.
- Let the AI authoring co-pilot draft an activity from a plain-language description — *T4 — Author with the AI co-pilot*.
