

Add and organise curriculum materials

Attach documents the tutor can cite, and keep them organised.

Where this fits

Curriculum materials are added **inside an activity** (guide T2). Open an activity, go to its **Materials** section, and attach the documents you want the tutor to draw on. There is no separate library to manage — you organise materials in place, in the context of the activity that uses them.

What materials do

When you attach a document to an activity, the tutor can **cite it** — ground its answers in your source rather than in general knowledge. You can attach:

- documents from the **shared corpus** — material already available to you, and
- your **own uploads** — a PDF, slides, a worksheet, notes, or an image.

Each attached document is either **visible** to students or **hidden** (used only to ground the tutor). You choose per document.

The co-pilot can help here too

When it drafts an activity, the AI **co-pilot** can also suggest curriculum materials to attach — see T4 — *Author with the AI co-pilot*. You can always add and organise materials by hand as below.

Step 1 — Open the Materials section

Open an activity for editing (or create one — guide *T2*). In the builder's section navigation, select **Materials**. The section lists the shared corpus you can browse, with an **Upload** button and controls to filter and organise.

The Materials section: browse the shared corpus, upload your own, filter by level, tag, subject or folder.

Step 2 — Attach a document

You have two ways to attach material:

- **Cite an existing document.** Use the **Search materials** box or the **level**, **tag**, **subject** and **folder** filters to find what you want, then select **Cite** on its row. It moves into the activity's cited list.
- **Upload your own.** Select **Upload** and choose a file (PDF, Word, slides, spreadsheet, plain text, or an image). AIPLA extracts the text and shows you **what**

it extracted, so you can confirm the document was read correctly before relying on it.

After an upload, AIPLA shows the extracted text so you can verify the parse.

Step 3 — Organise: folders, tags and subject

Keep a growing corpus navigable:

- **Folders** — group related documents; create one with **New** in the folder rail. Deleting a folder unfiles its documents rather than deleting them.
- **Tags** and **Subject** — set on a document so the filters can find it later.

These are shared organisation, so a document you tag well is easier for you and your colleagues to reuse across activities.

Step 4 — Control what students see

Each cited document has a **Visible / Hidden** toggle. Hidden documents still ground the tutor's answers; visible documents also appear to students in the activity. New uploads default to **Hidden** — make a document visible only when you want students to read the source directly.

Tip

Grounding works whether a document is visible or hidden. Use *hidden* for source material that should shape the tutor's answers without being handed to students verbatim.

Next steps

- Let the AI co-pilot assemble an activity — including suggested materials — from a description: *T4 — Author with the AI co-pilot*.
